## Native Plants \& Pollinators

## Plant Spacing Chart <br> CLEAN WATER <br> NATIVE PLANTS \& POLLINATORS

## How to determine the number of plants needed for an area.

| Spacing <br> (Distance Apart) | Number of Plants per <br> Square Foot |
| :---: | :---: |
| 3 inches | 16 |
| 4 inches | 9 |
| 5 inches | 5.76 |
| 6 inches | 4 |
| 7 inches | 2.94 |
| 8 inches | 2.25 |
| 9 inches | 1.78 |
| 10 inches | 1.44 |
| 12 inches | 1 |
| 15 inches | 0.064 |
| 18 inches | 0.044 |
| 24 inches | 0.025 |

To use the chart, multiply the number of plants needed per square foot for the specified spacing by the number of square feet to be planted.
Example: To cover the are of 200 square feet with plants spaced every 8 " on center, multiply the number of plants per square foot from the table above by the number of square feet to be covered.

$\frac{$|  Area to be  |
| :---: |
|  planted  |}{200 sq ft}$\times \frac{$|  Number of plants for 8"  |
| :---: |
|  spacing (from table)  |}{2.25 plants/sq ft}$=\frac{$|  Number of  |
| :---: |
|  plants needed  |}{450}
